

Chiller Design, Installation, Maintenance & Troubleshooting

INTRODUCTION

- Chilled water plants have been widely used in Air Conditioning and Refrigeration industry. The proper design of these facilities includes not only selection of adequate equipment, but also their optimization from the point of view of production, distribution, storage as well as the utilization for the given cooling load and minimization of operating and maintenance costs. Mastering fundamentals, sizing, operation, & troubleshooting is a must for designers & operators of refrigeration systems & water chillers.
- Chiller Design, Installation, Maintenance & Troubleshooting training course will enable participants to become familiar with the main phases in the design, installation, commissioning, operation, and maintenance of the chilled water plants. This course covers fundamentals of refrigeration systems starting from the vapour compression cycle, refrigeration systems & water chillers main components (types, selection & capacity control), accessories & system level control, piping sizing & installation, refrigerants, oils, & safety, systems & component measurements, refrigeration systems diagnostics, servicing & troubleshooting, commercial & industrial water chillers, chillers operation & maintenance, systems & water chillers energy conservation & peak efficiency.

Participants on Chiller Design, Installation, Maintenance & Troubleshooting training course will develop the following competencies:

- Best practices and procedures for installation, start-up and commissioning of chilled water systems
- Methods of efficiency optimisation in operation and maintenance
- Minimisation of overall costs
